Amino Devices

Proven performance and unmatched reliability

Pay TV operators have been delivering video services to the consumer home for decades. The device that presents that service for consumption is the set-top box. It sits side by side with various other devices enhancing the consumers home entertainment experience.

With over

10 million

IP-connected TV devices shipped

Serving over

250

operators and enterprise customers

We understand the appeal and importance of video.

Given its location within the subscriber home, the set-top box must fulfill expectations of both the pay TV operator and the consumer. Amino recognizes the evolution in how consumers want to enjoy TV and video content, and how media companies deliver it.

Our goal

is to simplify access in an increasingly fragmented media landscape.

Operators demand reliability

Consumers expect video and all of the enabling technology around it to work. They don't care how it works, they just want it to work. Our Amino Devices, powered by our widely deployed and proven Enable software or our Android TV Operator Tier certified Apollo software, fulfill requirements for performance while enhancing the capabilities of the hardware.

Unfortunately, issues can arise. Amino provides the tools to simplify lifecycle management of deployed devices, so that when an issue does occur, it can be addressed quickly, minimizing the impact on the subscriber.

Operators demand simplicity

We understand that operators have their eye on the bottom line and want to reduce truck rolls. Our self-install wizard guides subscribers through device set-up lessening the need for service technicians to visit consumer homes. In addition, our SaaS based Amino Engage platform gives operators a centralized view of deployed devices, helps them to manage software, firmware and app updates while also providing customer support reps a remote view of a subscriber's set-top box and connected TV to accelerate call resolution.

Consumers demand quality

Consumers expect high-resolution video. Not only do our devices support 4K UHD content, they can reduce bandwidth requirements by up to 50% with HEVC support. In addition, for our U.S. customers, our MoCA enabled devices capitalize on the high-bandwidth capacity of coax cable for high quality in-home delivery of real-time traffic such as live sports.

Consumers demand choice and convenience

Consumers love content and they want access to content from many platforms. Amino Devices already support live and on-demand linear content. They also easily integrate with various OTT platforms such as YouTube, Amazon Prime, Netflix, Disney+ and others – helping consumers overcome cord confusion by accessing all content via HDMI1!

Our devices continue to evolve to reflect technology advances related to delivering higher quality content cost-effectively and efficiently. They easily integrate with any video delivery ecosystem and assimilate into any home entertainment center with ease.
